

(Version 1)

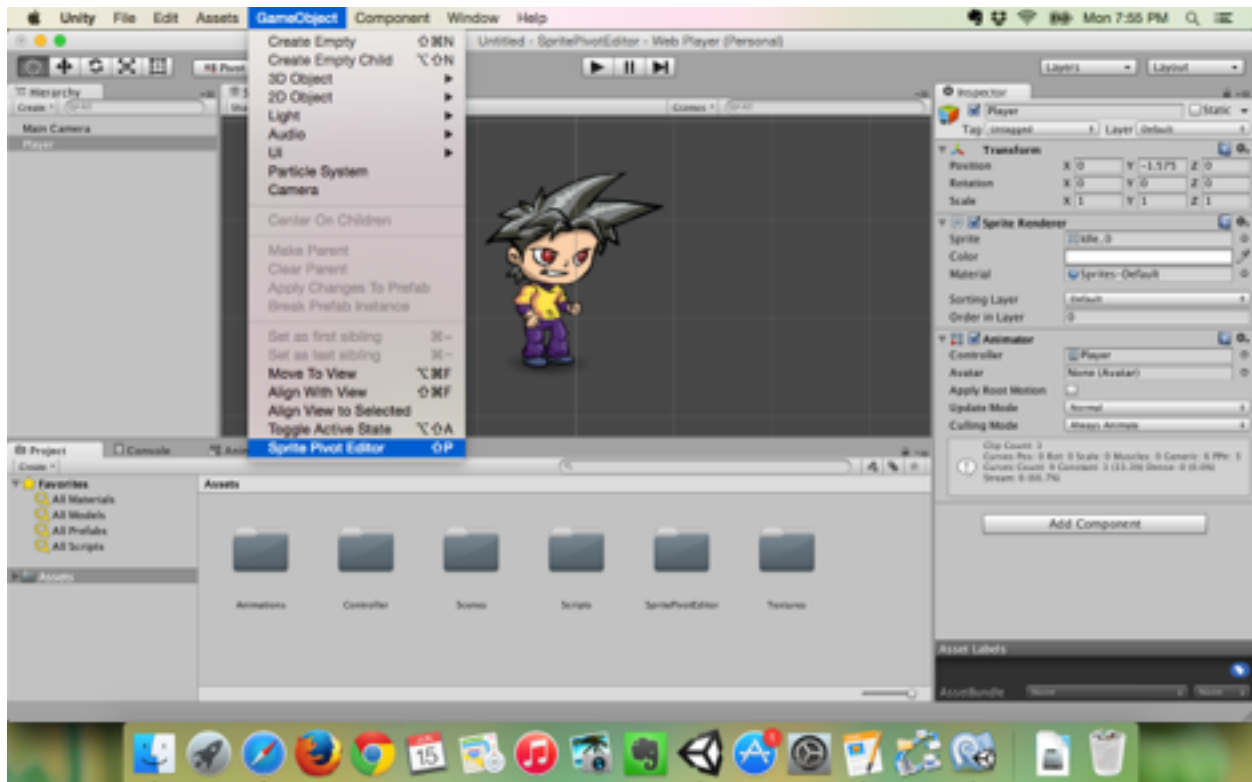

What this is

This is an editor extension that runs in the scene view, and any game object with an Animator component can use this extension as long as it deals with sprite animation. The extension allows you to preview the animation, and modify the sprite's pivot accordingly from the scene view, to make sure that those sprites align correctly with each other with whatever animation clip they belong to. You can also use this extension along with the Sprite Renderer component to modify the pivot point of whatever sprite it holds from within the scene as well. Click on the following link to see a video demonstration of what this is like.

[Demo](#)

How To Use

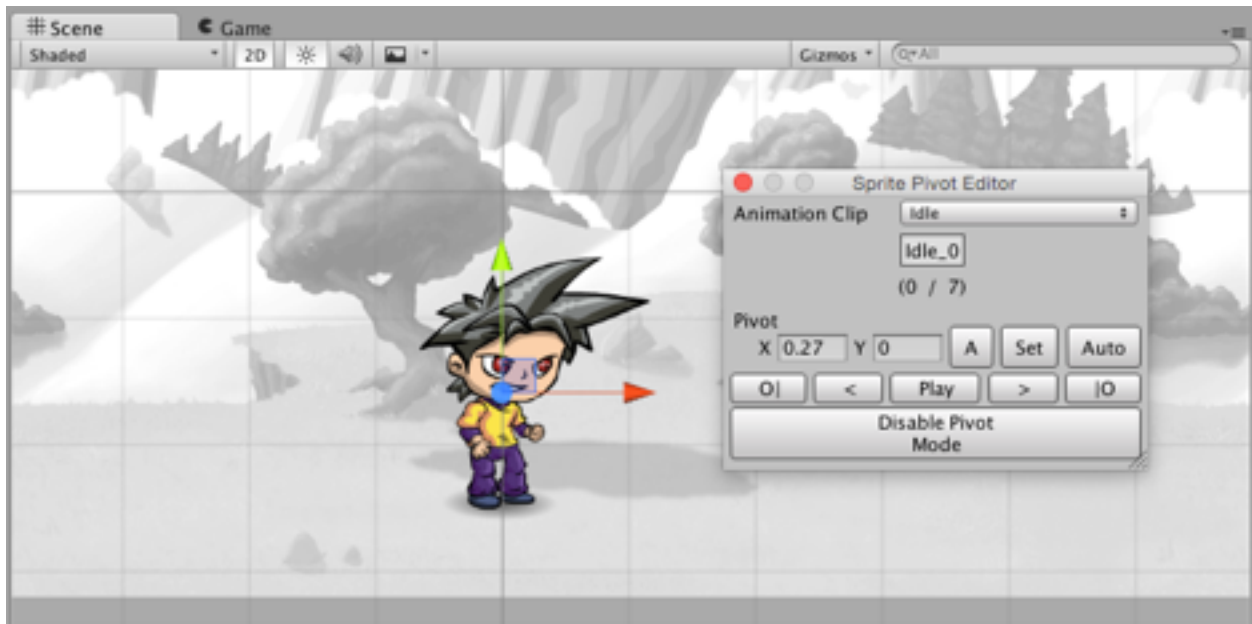

In order to use this extension, you must first enable it from the following menu item
GameObject/Sprite Pivot Editor

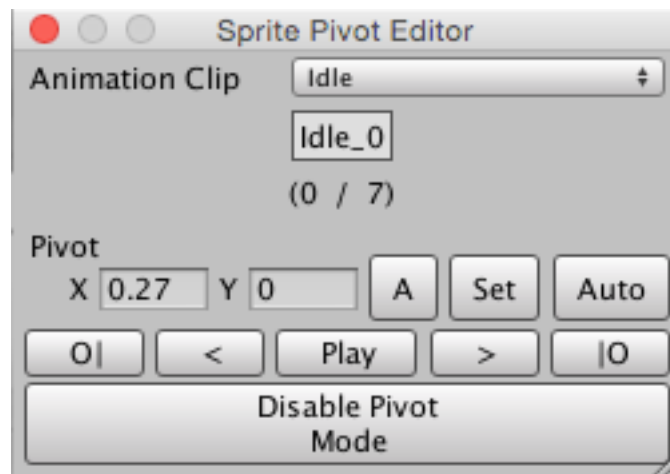

Once enabled one of the following window will be shown depending if you are dealing with animation or not.

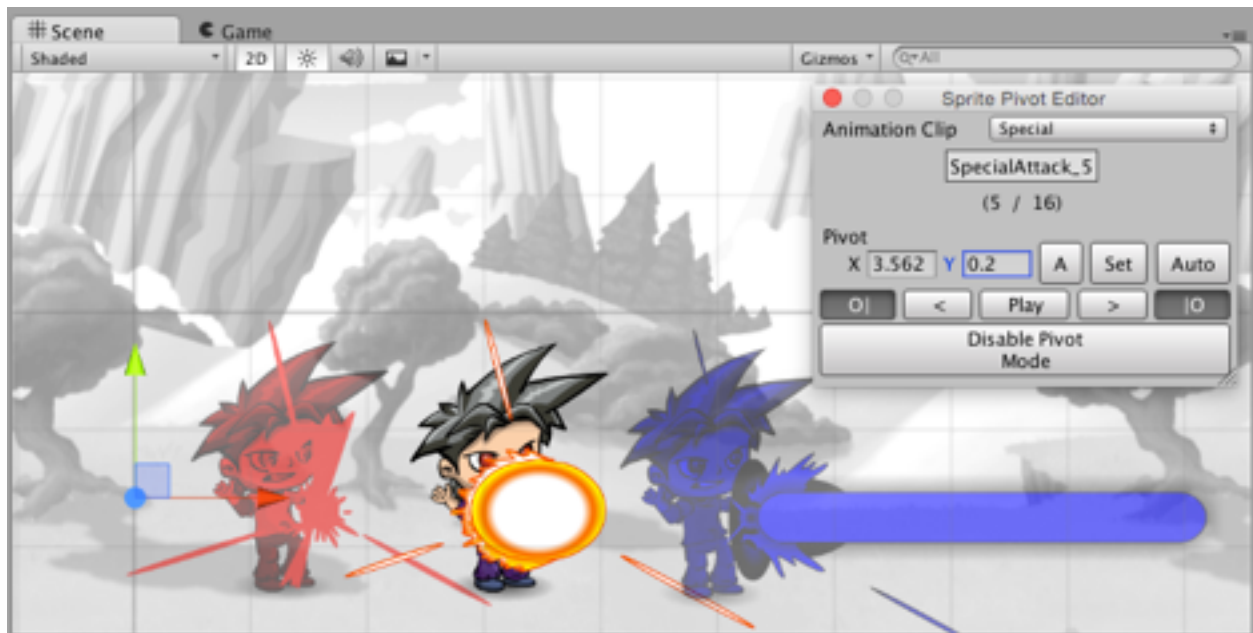

To modify the sprite's pivot you must click on the Enable Pivot Mode button, and once you do that, the scene will fade everything except the selected game object like show below

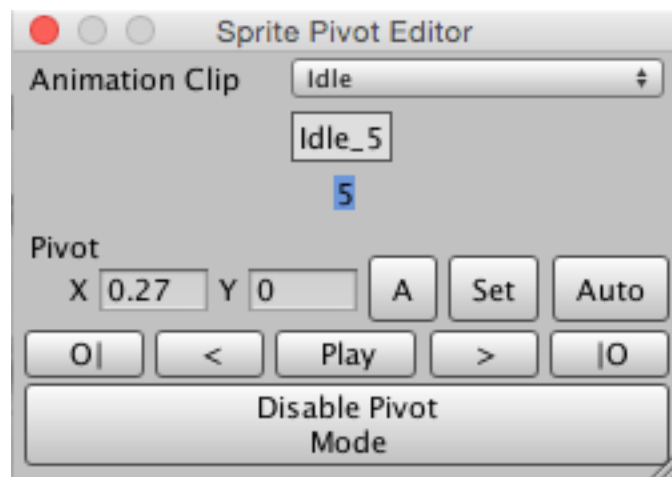

From this point you are able to modify the pivot how ever you like.

If you are dealing with animation, you can select which sprites from which animation clip the game object has that you would like to work with from the drop down menu. Once an animation clip is selected, you can scroll through the sprites in the animation clip with the <, > buttons. To help with the alignment of the animation, you can enable onion skin to show the previous and or the next sprite frame of the selected animation clip as shown below

If you like to jump between sprites within the animation you can just double click on the index counter label, and enter the sprite index you like to jump

In either window you can modify the sprite pivot from pivot GUI field or drag the game object in the scene with the mouse. In order for the changes to take effect you must click on the Set button.

If you click on the A button, another window will appear as show here

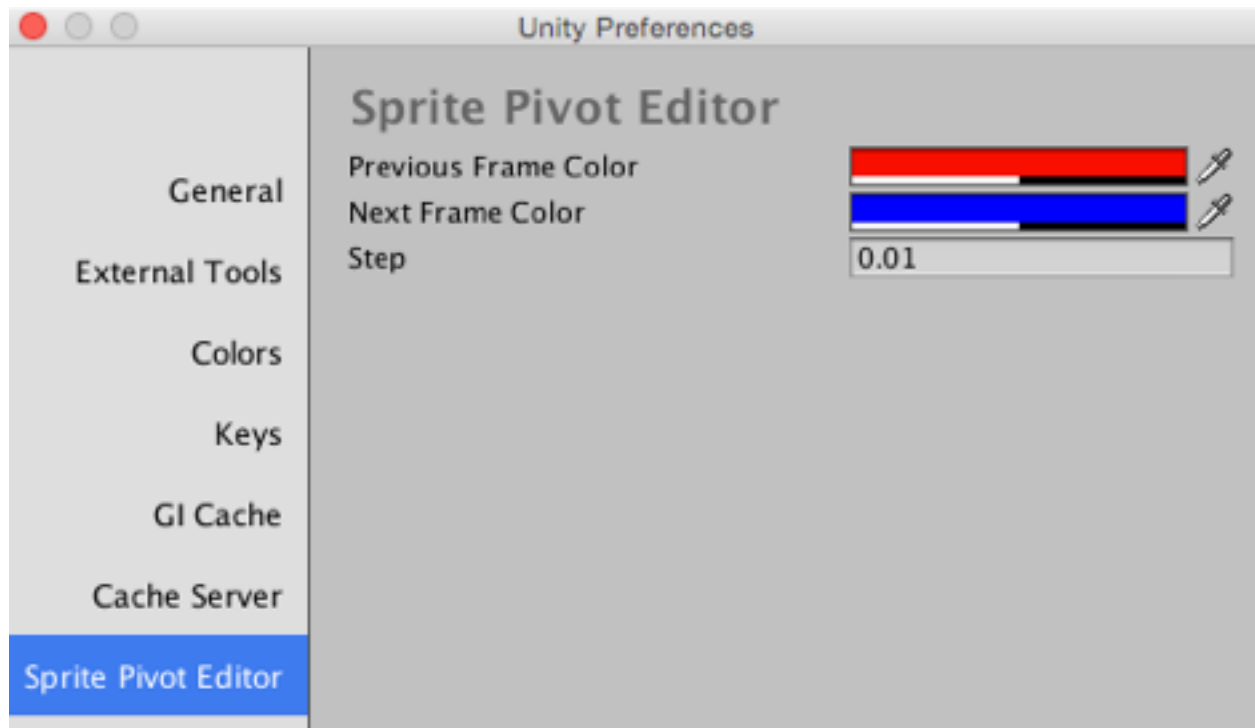

From this window, it gives you more control of the alignment. If dealing with animation, Loop Through All After makes sure that whatever sprite alignment you select will be pass through all remaining sprites after the current sprite frame you are working with in the animation clip.

Keyboard Shortcut

-You can copy and paste a sprite pivot value to another sprite using ctrl C, ctrl V if using a PC, and cmd C, cmd V if using a Mac

Preferences

This extension comes with the following preferences which you are able to change accordingly to you're liking.

You can change the onion skin color from here. You can use the arrow keys to make minor changes to a sprites pivot, step is the amount of offset added in each direction.
